MBc360 App Development

Round 5 - Answers

5 November 2026

1. Critical N/A items and the responsible reviewer

(a) Use the following item-level classification. “Critical” here means an N/A rationale needs acknowledgement; it does not assign a Critical risk rating to the project.

Row	Gate	Item	Critical?	Acknowledgement function
1	2	Product form left open / tracked confirmation	No	Project owner
2	2	Infant-use context	Yes	Safety
3	3	Competitor / benchmark review	No	R&I / Marketing
4	3	High-risk / borderline claims review	Yes	Regulatory
5	4	Pregnancy / breastfeeding caution screen	Yes	Safety
6	4	Allergen, impurity and contaminant review	Yes	Safety; Regulatory if limits apply
7	4	Infant ingredient / raw-material suitability	Yes	Safety
8	5	Product form confirmed earlier	No	R&I
9	5	Preservative strategy	Yes	Quality / microbiology reviewer
10	5	Infant formula-level assessment	Yes	Safety
11	5	Commercial feasibility when target cost is Must	No	Commercial approver
12	6	Infant packaging and instructions	Yes	Safety; Quality for pack controls
13	6	Market-specific pack requirements	Yes	Regulatory
14	7	Formula matches taken up on maternal caution list	Yes	Safety
15	7	Maternal caution assessment closed	Yes	Safety
16	7	Maternal and infant-contact assessment	Yes	Safety
17	7	Infant compartment INF-01 to INF-08	Yes	Safety
18	8	Infant testing triggered by use and risk	Yes	Safety / study reviewer
19	8	Human-study approval before recruitment	Yes	Authorised human-study reviewer
20	9	Preservative efficacy status	Yes	Quality / microbiology reviewer
21	9	Scale-up / pilot status	Yes	Quality with Manufacturing / R&I
22	9	Infant stability, microbiology and in-use testing	Yes	Quality with Safety
23	10	ASEAN PIF checklist	Yes	Regulatory
24	10	ASEAN PIF mapping	Yes	Regulatory

Row	Gate	Item	Critical?	Acknowledgement function
25	10	Infant PIF content and claim evidence	Yes	Safety and Regulatory
26	10	Product-performance evidence	Yes	Technical claims reviewer
27	12	Scheduled market feedback review	Yes	Quality / post-market reviewer
28	12	Baseline post-market surveillance	Yes	Quality / post-market reviewer
29	12	Enhanced PV/PMS review	Yes	Safety with Regulatory
30	12	Product-performance feedback	Yes	Quality; Technical for claim impact
31	12	Change-control links	Yes	Quality / change-control reviewer

(b) Use an item's assigned qualified reviewer. The phase “Reviewed by” may acknowledge only where that person also holds the required subject authority. Safety items require Safety/Scientific Review; Regulatory items require Regulatory; claims require Technical and any necessary Regulatory review; release/quality items require Quality. Where both functions are needed, both conclusions must be recorded. Do not infer authority from an administrator account or an unassigned Owner cell.

(c) Yes. A material change to target users, formula, markets, evidence or the rationale invalidates the affected acknowledgement. Reassess the item against the new facts. Pure spelling or formatting corrections may retain the acknowledgement with a recorded editorial change.

(d) Preserve the list version used in the signed snapshot. Open and reopened assessments use the current controlled list. A relevant list change creates a tracked impact assessment, with an owner and due date. A credible Critical safety issue, prohibition or mandatory market restriction puts affected current use/release on hold pending qualified review. Other changes trigger notice and assessment; Safety/Regulatory and Quality decide scope, urgency and any reopening. A notice alone cannot resolve a new material risk.

Trigger corrections: Missing development/change data cannot justify N/A for competitor review. An anhydrous formula needs a documented microbiological-risk conclusion before a preservative/PET waiver. No watch-list match does not prove that allergen or impurity review is unnecessary. Enhanced-surveillance N/A must assess all applicable triggers, including those not yet structured in the app. Maternal/infant exclusions must consider intended and reasonably foreseeable contact, not only marketing ticks.

2. One Change Control assessment per post-market finding

(a) Yes, one assessment per distinct finding, linked to the review cycle and affected market(s). Several complaints may support one trend finding; one finding may affect several markets. An existing open CHG record does not waive assessment of a new finding.

(b) A finding is an issue requiring a documented review: an individual complaint or adverse event where assessment is needed; a complaint trend; a quality deviation; a regulator request; a substantiated claim challenge; or a performance/packaging concern. A single event can be a finding; a trend is not required. Record “no findings requiring Change Control” for a completed review with none, with reviewer, date and rationale.

(c) Add a generated Finding ID, source/category, source record link, date identified, affected SKU/formula/batch and market(s), review-cycle ID, severity/priority and disposition. Yes/No/Pending must each carry reviewer, date and rationale; Yes links a relevant CHG record. Pending blocks closure of that finding and an unrestricted close-out of the affected review. Unrelated markets may continue where their own requirements are met.

3. Superseded High or Critical safety findings

(a) Link the replacement assessment and carry forward unresolved hazards and actions without duplicating the closure package.

(b) Require a valid replacement Finding ID, Safety reviewer's reason/conclusion, date of supersession, link to the replacement assessment/evidence and confirmation that each outstanding action is transferred, retained or validly cancelled. Record who authorised and verified the supersession. Use a supersession date rather than falsely recording hazard closure. Gate readiness follows the replacement and any retained actions; an open replacement High/Critical issue retains its applicable block. Prevent circular chains and preserve both records.

4. Watch-list matching and reviewer disposition

(a) Yes. Automatically flag potential formula matches on both lists. Retain the matching result separately from the reviewer's disposition, with formula/list version and match basis. A changed formula must mark a prior conclusion for reassessment where its basis changes, even if a person previously selected a status.

(b) Gate 4 records the initial screen. Matching and assessment remain current through formulation; Gate 7 closes issues for the final formula. Subsequent relevant changes require a new controlled assessment. Ordinary pre-lock trial refinement can update the screen without reopening every earlier gate; a new material, hazard or restriction that invalidates Gate 4 must reopen its affected review. Gate 7 is the final safety checkpoint, not permission to ignore an earlier unsafe change.

5. Formula supersession and transition

(a) Each fact is confirmed by its accountable function - R&I; for formula identity, Quality/Manufacturing for batch and last-release facts, Regulatory for PIF/notification/labelling obligations, Supply Chain for stock disposition, and Sales/Marketing for market communications. Quality coordinates final per-market supersession; the authorised final approver confirms the completed transition. Assign named authorised signers to these functions.

(b) Use approved market implementation/release of the replacement at Gate 11 as the normal start of transition. Gate 10 dossier approval alone is insufficient. A different approved implementation date may be set in the CHG transition plan. Keep Active/Transition/Superseded per market and derive the overall version status from those market states.

(c) No automatic immediate transition for a Minor change. Use its approved effective date and actual stock/release implications. A documentation-only correction that leaves the manufactured formula unchanged is a document revision and does not require a stock transition. Classification as Minor never removes an affected safety, regulatory or release check.

(d) Yes, a never-released development version may be superseded without a sales/stock transition. Record the replacement and reason, and confirm there was no release. Retain its trial and study history.

(e) Keep the market surveillance schedule and separate version/batch traceability. A materially changed launched formula needs its own early performance/safety review milestones. Do not restart or erase the older version's obligations; combined market reviews may cover both where the analysis identifies each version.

6. Critical changes to the Claims Library

(a) Use the same Low/Medium/High/Critical terminology with a defined claims-impact assessment. Withdrawing wording is not automatically a Critical event or a product withdrawal.

(b) Regulatory records the market/legal impact; Technical records the evidence impact; Safety contributes where a safety issue is involved. Criticality is confirmed by the relevant qualified function(s), with Quality

coordinating action. Product stop-sale/withdrawal is an authorised company decision, except that an urgent safety or mandatory restriction must trigger an immediate hold and escalation. A software status must not itself issue an external recall.

(c) Automatically identify affected records and create an impact-assessment task. Regulatory and Technical, with Quality, determine whether CHG is required. It is required when a change affects approved/released wording, artwork, PIF or authorised market use. An unused entry or editorial correction can close with a reason and no CHG. Suspend further use of withdrawn wording; assess existing stock and published material under the transition plan.

7. Scale-up assessment and the eighteen affected areas

(a) Choose (iii), linked to (ii). Use the existing controlled list of eighteen areas. Use an entry for each affected area, recording before/after details, Yes/No/Pending risk, reason, required pilot/verification, evidence, assessor and date. Record a reviewed “no affected area / no scale-up activity required” assessment where appropriate; an empty list is incomplete. Group the areas for display as process/site/scale, formula/materials and other performance risks, while retaining their existing identities. The open-ended area requires a description. Post-lock changes link the assessment to CHG; pre-lock work may link to the iteration. Area selection triggers assessment; it does not predetermine a Yes risk verdict. Any Pending entry blocks Gate 9; any Yes requires the specified verification.

(b) “New development” in either primary or secondary scope triggers mandatory assessment. A Major reformulation also triggers it. Other reformulations still require a documented risk screen and pilot/scale-up work if the change can affect manufacture or performance. The change type is a trigger, not the only evidence used.

(c) A new formula must have a scale-up/pilot assessment. A No conclusion may be recorded, but cannot switch that assessment off. Waiving a separate pilot requires Quality, Manufacturing and R&I; to justify equivalence to a qualified process and link supporting verification. A bare No cannot waive manufacture-readiness evidence.

8. Authority to accept watch-list findings

(a) Yes, the qualified subject reviewer records technical acceptance on the finding; the overall gate approver may rely on that approved conclusion. This clarifies the earlier wording. The gate approver remains responsible for accepting the stated conditions and verifying that the required functions have reviewed them. If both Safety and Regulatory are relevant, obtain both; if neither is assigned, route for triage rather than allowing either by default. An administrator cannot supply a scientific acceptance without the required authority.

(b) Authority applies to every substantive assessment that clears or changes a safety/regulatory finding, including “No issue identified”, “Considered - not selected” where it removes a match, closure and conditional acceptance. Draft entry may be delegated. “Further information required” alone is not acceptance: a qualified reviewer must separately conclude that the remaining uncertainty is non-critical, bounded and safe to carry, with a linked action. A prohibited ingredient/use or unresolved critical safety uncertainty cannot proceed conditionally.

9. Controlled actions for gaps

Choice Use tracked Next Actions for every gap left unresolved when a gate proceeds, including High, Medium and Low, and for every deferred Should/Could requirement. Critical gaps block progression. A Low/Medium gap resolved before signing needs its resolution/evidence recorded; it need not create an action solely to close it immediately.

The action holds a unique ID, source gap/finding/requirement link, description and completion criteria, accountable owner, due date, priority, escalation trigger, status, evidence and closure/verification details.

The gap displays the linked owner/date rather than storing competing copies. High gaps additionally require qualified acceptance of the residual risk and must not concern a mandatory safety/regulatory/release prerequisite. A due date buried in free text is insufficient.

10. Change Control and gates already passed

Choice Choose (3): controlled impact assessment and reopening of invalidated decisions. On opening CHG, flag the affected gate/version/market and require triage; a potentially material or unassessed release impact holds affected current readiness pending assessment. On confirmed material impact or approval to implement the change, reopen the affected decision(s). Keep the earlier signed snapshot in history.

The trigger provides a minimum suggested scope; Quality with the relevant technical functions confirms the full scope. Reopen all affected gates, not only the earliest, and enforce their dependency order. Formula ingredient changes normally reassess Gates 4-9 plus affected market Gates 10-11; user/claim changes can also affect Gates 1-3. A post-market change opens a linked Gate 12 review for the affected market/version without erasing earlier surveillance reviews. A justified administrative correction can use a controlled addendum without reopening substantive approvals.

Re-decide using the normal options: Proceed once fully resolved, Proceed with Conditions only for accepted non-blocking work, or Hold/Backtrack. Do not force every reopened gate to remain conditional. Record reason, CHG ID, scope, owner and authorised sign-off. Rejected/Cancelled changes need recorded confirmation that no controlled implementation occurred and no residual impact remains before readiness is restored; if implementation occurred, assess and verify reversal/correction. With multiple changes, each affected check must be resolved or validly accepted; closing one does not release the others. Gates 11-12 follow the same recorded-history principle.

11. One master controlled-change record and linked specialist records

(1) Use one master CHG record for each controlled change, with linked area-specific assessments, tasks and approvals. A change covering formula, artwork and claims normally has one master CHG with those scopes. Separate linked CHGs are appropriate only for independently managed changes with different timing or accountable decisions.

Existing place	Purpose in the application
Change Control & Communication Log	Master controlled-change record: scope, impact, risk, approvals, implementation, verification, communication and final disposition.
Formulation Change Register (FC)	Filtered formulation view of the master record, preserving the specialist formulation fields and NP approval. Existing FC IDs remain aliases.
Formula Change Control	Controlled trigger/approval rulebook. Occurrence-specific old/new versions and status belong to CHG-linked assessments.
Artwork Change Control	Controlled artwork trigger/approval rulebook. Individual artwork changes link to CHG.
Released Label vs Current Artwork Register	Operational reconciliation and market-release record; link discrepancies and corrective changes to CHG.
Development Iteration Log	Trial history before formula lock. Keep separate from controlled-change authorisation.
Ingredient Substitution Evidence	Technical evidence for a substitution; link to the iteration before lock or CHG after lock.
Product Family & Version Register	Identity and relationships among products, variants, formula/pack versions and markets; links to CHG where applicable.

Existing place	Purpose in the application
Formula version history	Permanent version/state history, linked to its iteration or master CHG. It is not an independent approval route.

(2) Gate 5 formula lock is the normal boundary. Routine unlocked trials use the iteration log. Any change to an already approved formula, market authorisation, released pack/claim or other controlled baseline requires CHG, even if the project has been sent back to Gate 5. Backtracking does not erase that controlled history. Retain a CHG for every Major version including a clearly identified development-only change where appropriate; apply release impacts only when a released baseline is affected.

(3) Make the formulation register a filtered view with its specialist fields and permissions. Keep NP's commercial decision, date and authenticated sign-off on the shared record; technical, safety, regulatory and quality approvals remain separate requirements. Commercial approval cannot replace them. A Closed tick alone is insufficient: retain the specified final disposition, implementation, verification and communication record.

(4) A valid link resolves to the right project/product and relevant scope, with a reviewable status and owner. An FC row counts only if it resolves to the master CHG; an isolated FC row does not. Status depends on purpose: an assessment can link an open CHG, implementation needs an approved CHG, and closure needs verified final disposition. A historical completed CHG can be a valid reference. A rejected/cancelled record cannot authorise implementation. Preserve imported text and flag unresolved legacy references rather than discarding them.

12. Adding markets and reopening earlier decisions

Choice Choose (3). Adding a market creates its own Gates 10-12 track and a mandatory Regulatory impact assessment, with Safety/R&I;/Quality input as needed. Until assessment is complete the new market cannot release; existing markets continue unless a shared issue is identified.

Difference identified	Reviews to reopen or extend
Ingredient restriction / permitted level	Gate 4 ingredient compliance; Gates 5 and 7 if formula or safety changes; Gates 8-9 if testing/manufacture is affected.
Claim / intended use / user population	Gate 3 claim scope; Gate 2 where users/exposure change; Gates 7-8 where safety or evidence must change.
Pack, language, warning or declaration	Gate 6 packaging/label requirements and relevant market Gates 10-11; Gate 9 if functional pack compatibility changes.
New safety / exposure requirement	Gate 2 exposure as needed, Gates 4 and 7, and relevant Gates 8-9 for additional verification.
No substantive difference	Record Regulatory's signed equivalence conclusion and reuse the approved evidence; no blanket backtrack.

For a Major formula change, retain reassessment of Gates 4-9 and affected market release decisions. Do not automatically invalidate unrelated markets using an unchanged approved formula. Earlier Gate 12 reviews remain historical records; initiate the new affected review/monitoring cycle. Record the added market as an approved scope amendment to the Gate 1 baseline.

13. Register closure and signatures

(a) Do not require two new signatures on all 70 registers. Require a controlled review for evidence used in a gate decision, using existing report/register approvals where available and the gate snapshot to identify accepted versions. Reference lists, working notes and automatically derived views do not each need a separate close-out ceremony. Mark register approval requirements in the Gate Rules & Sheet Map.

(b) Use the assigned evidence owner plus an independent qualified reviewer for a substantive evidence assessment; use its existing Prepared/Reviewed/Approved block where it has one. The gate supplies the final progression decision. Additional specialist approval is needed where Safety, Regulatory, Quality or NP authority is required. Do not duplicate the same approval across a parent view and its supporting record.

(c) One person signing twice is one person. Where independent review is required, block closure until a distinct qualified reviewer is assigned. At low-risk working/reference records, remove the unnecessary second signature rather than show a permanent warning. Apply the person rules in Question 23.

14. N/A in Phase 2-4 requirements

Answer Yes, with a specific rationale and relevant reviewer acknowledgement for critical items. The list of universally required assessments must never be waived: project identity/use/market scope, formula identity and traceability, general ingredient restriction/caution screening, final safety conclusion, product-quality/stability/microbiological-risk assessment, applicable dossier/compliance closure, approved release controls and due post-market review. Individual tests or conditional compartments may be N/A within those assessments; the assessment itself remains required.

Infant/baby rows can be N/A where their stated trigger genuinely does not apply, including justified test waivers. Once infant use/contact is in scope, the core infant safety conclusion cannot be waived. Record a justified N/A for an entire compartment when it is outside scope.

15. Deferring Should/Could requirements

(a) Create a controlled Next Action linked to the deferred requirement, with owner, due date, completion criteria and escalation. Gate 2 cannot pass conditionally without it. Must requirements cannot be deferred by relabelling them Should/Could; a changed requirement needs an approved scope change and impact review.

(b) Yes. Every applicable requirement needs Must/Should/Could priority. N/A rows require rationale. A blank priority is incomplete.

16. General restricted and caution assessment

(a) Regulatory and Safety supply and approve the controlled sources and company overlays, with versions and effective dates. The two twelve-row Excel lists are screening prompts, not proof of a complete market restriction screen. Load only the approved current company list.

(b) Keep an explicit reviewed conclusion that screening was completed, including “no restricted/caution issue identified” where supported. For a product, this general assessment is mandatory: no findings means Complete with evidence, not N/A. An empty findings register is acceptable only alongside that conclusion.

(c) Yes. Use Gate 4 for initial screening/disposition and Gate 7 for final-formula closure, with reviewer trails for flagged issues. Keep updates linked to formula, market and source versions.

(d) The five outcomes are usable. Add “Further information required” and “Considered - not selected” for consistency with Question 4. At Gate 7, unresolved review/information requirements block final safety closure unless a qualified reviewer explicitly accepts a non-critical residual action under Question 8. “Restricted, reformulate” and prohibited use block until corrected. “Within limit” needs concentration/exposure, market basis and evidence, not only a status selection.

17. Publication channels and claim-use approval

(a) Use: Packaging/label; Website; Social media; Sales/distributor material; HCP/professional material; Retailer/e-commerce listing; Advertising; Other - specify. Treat “Release to Print” as an event for the Packaging/label channel, alongside Published/Deployed, Updated, Withdrawn and Superseded. Record actual print release separately from actual market deployment.

(b) “Complete” is a work status, not approval. Add an explicit claim-use decision: Pending; Approved; Approved with Conditions; Not Approved; Withdrawn. Record approved claim revision/wording, SKU/formula, market, channel, Technical/Regulatory approvals as required, decision date, restrictions and review date. Conditions must be met for the intended use. Artwork/publication reads that decision and the matching revision; a Complete row alone cannot authorise a claim.

18. Gate 3 claims review and revision approval

(a) A Not Approved claim may remain as a clearly excluded historical/rejected concept, but cannot be in the active Gate 3 claim scope. Further Information Required also prevents that claim from advancing. Remove it from active scope or resolve/reword and re-review it. Approved with Conditions requires the recorded evidence plan and accepted conditions; Gate 3 approval is concept approval, not permission to publish.

(b) Yes, use outcome, qualified reviewer, date, rationale and evidence link. A current Claims Library approval may be reused only for the exact wording and covered context; record the library revision and verify product, evidence, market and channel fit. A new formula/application cannot inherit technical substantiation solely from matching library wording.

(c) The authorised Regulatory reviewer approves market/wording compliance and the authorised Technical reviewer approves substantiation where required. Gate 10 confirms those decisions; being a gate approver does not itself grant Regulatory authority. Freeze the exact approved revision; amendments create a new revision and the necessary re-review. Sign only in the reviewer's own identity.

19. Independent market gates and withdrawn markets

(a) Choose (ii), with a market-specific closure period and criteria set by Regulatory/Quality based on remaining stock, last supply/expiry and applicable obligations. Continue surveillance and unresolved complaint/adverse-event/CAPA follow-up after commercial withdrawal where needed. A never-launched withdrawn market may close with a reason. Do not silently remove an existing market's Gate 12 obligations.

(b) Choose (ii). Gates 10-12 open, sign and pass per market, after the shared Gates 1-9 prerequisites. Vietnam can release when its own Gate 10 and Gate 11 are satisfied while Australia remains pending. The project overview shows each market and a derived “some/all markets ready” summary. Shared formula/safety issues still affect every relevant market; one market's dossier delay does not block the rest.

20. Gate 10 checklist and regulatory decisions

Passing values Require checklist Complete, or a properly authorised N/A for a genuinely inapplicable component. Regulatory decision Approved with Conditions can pass Gate 10 only where the conditions are documented, permitted at that stage, and linked to controlled actions. A condition required before launch blocks Gate 11 until met. Pending, Not Approved, On Hold/Blocked and Withdrawn do not authorise release. Separate internal Regulatory compliance approval from any external notification/authorisation evidence; they are not interchangeable.

Multiple rows Allow several dossier/compliance components per market, each with a component/dossier type, version and unique ID; assess all applicable components. Keep one derived market summary. ASEAN PIF mapping/checklist can be shared evidence, but each market still needs a country-specific regulatory/readiness conclusion and any additional local requirements. Synchronise summary values from the same underlying decisions; do not maintain contradictory approval fields.

21. Commercial feasibility at Gate 5

Answer Neither “Feasible with Conditions” nor “In Progress” demonstrates unconditional achievement of a Must cost target; neither permits plain Proceed. Feasible with Conditions can use Proceed with Conditions with commercial acceptance and tracked actions. In Progress needs enough assessed costing to bound the outstanding risk, otherwise Hold. Not Feasible normally means Hold or an explicit authorised revision of the commercial requirement/business decision; a conditional signature alone cannot declare a failed Must requirement met. N/A requires a justified scope decision, not missing costing.

22. Performance feedback and early post-launch review

(a) Triage and assignment alone close the intake step. The performance finding also needs a recorded assessment, conclusion, evidence, impact on claims/quality and CHG decision. Corrective work requires verified closure, or an explicitly accepted non-critical open action with a due date in the current review. No separate duplicate performance report is needed if these fields are in the same Post-Market/CAPA review. A Critical unresolved issue blocks closure.

(b)(i) A significant adverse event, material quality signal, regulator request or meaningful complaint trend brings review forward. Log other reports for triage; every minor query need not start a full review. Record severity, significance, reviewer and escalation decision. Urgent safety triage must not wait for a scheduled milestone.

(b)(ii) Record trends in Post-Market Sources/CAPA: source records, period, market, product/version/batches, number of reports, denominator where available, comparison period, interpretation, reviewer/date and action. Do not require an arbitrary universal numerical threshold.

(b)(iii) Yes. Distinguish performance/efficacy questions, safety/adverse events, quality/packaging, regulatory and general information. A performance challenge triggers technical review according to significance; a routine wording query can be handled without advancing the whole review schedule.

23. When one person may hold two roles

(a) Rule: at critical Gates 3, 4, 7, 8, 9, 10 and 11, use three distinct authenticated people for Prepared, Reviewed and Approved, including the required independent qualified function. At other gates, require the preparer to differ from reviewer and final approver; reviewer and approver may be the same qualified person. One person may prepare multiple different gate records.

(b) Owners may complete actions and submit evidence. Independent verification is required for Critical/High actions and those closing safety, regulatory, claims, release or material quality risks. Nominate a qualified verifier; a raiser/gate owner may verify only if competent and independent of the work. Low-risk administrative actions may be self-closed with evidence and an audit trail where their action type permits it. Cancellation of a substantive action requires authorised justification and impact review, not only owner access.

(c) For a controlled formula change, the initiator may propose Major/Minor but a different authorised Technical/Quality reviewer must confirm. Being qualified does not make self-confirmation independent. The creation dialog should record proposer and confirmer separately.

(d) At phase closure require an independent review: preparer differs from reviewer and approver. Reviewer may also approve the phase summary where permitted, since the underlying critical gates already have their distinct approvals. If the phase approval makes a new substantive critical decision, apply the three-person rule. No duplicate phase approval may override a failed gate.

24. Critical actions and gate progression

(a) An open Critical action blocks both Proceed and Proceed with Conditions for its affected gate/scope. Hold/Backtrack remain available. “Blocks every decision” must not prevent recording those protective decisions. No risk-acceptance override allows a prohibited or unresolved Critical issue to release.

(b) Once independently verified closed, a Critical action does not force a permanent conditional decision; plain Proceed is possible if all current criteria are met. Cancellation needs reason, qualified authorisation and confirmation of no residual issue. A mistaken duplicate/misraised action can be cancelled with that trail. Never cancel merely to remove a block; resolve any associated finding as well.

25. Updating a PIF while an approved version remains on sale

Answer Do not force withdrawal of the approved existing version merely because a draft PIF update is opened. Keep the approved PIF/version and market launch decision intact; create a separate draft revision under CHG. The new formula/PIF version cannot release until approved. If new information undermines the current version's safety/compliance, Regulatory/Quality must suspend the affected current approval and record the reason. Version-specific approvals prevent a draft edit from either cancelling a valid approval or silently changing its basis.

26. Unapproved publication and deviation records

(a) Yes, prevent approval/release within the workflow when prerequisites fail. Log discovered external unapproved publication as a deviation; do not label it approved retrospectively.

(b) Record Deviation ID, discovery/incident dates, reporter, SKU/market/channel, content/claim and revision, URL/file/screenshot, approval expected versus actual, scope/duration of use, severity and impact assessment, containment/correction, owner, due date, reviewer and disposition. Link CAPA/CHG, root cause where needed, verification/effectiveness and closure decision/date. Preserve evidence of the original incident.

(c) Block affected Gate 11 release where the deviation leaves an unresolved safety, compliance, claims or version mismatch. Gate 12 records and reviews it; Critical unresolved cases block the affected review's closure. A non-critical deviation may remain under explicitly accepted controlled actions. Do not globally block unrelated products or markets.

(d) Yes. Show expiry/review-due and withdrawn/superseded content warnings to accountable owners and track the disposition. A review date becoming due triggers re-review and any defined use restriction; it does not by itself prove unlawful prior publication. A known unsupported or prohibited claim needs prompt containment. Actual withdrawal/publication events remain separately recorded.

27. Accepting pre-work

Answer The accountable subject-area owner accepts the relevant entries when that phase/gate opens. The phase review owner coordinates acceptance. A Project Lead may accept only for areas where that person also has the required authority; project leadership alone cannot accept Safety/Regulatory conclusions. Mark individual entries with author/date and pre-work status, then accepted/updated/rejected, reviewer and date. A batch acceptance is acceptable only with an explicit list of the entries and authorised reviewer coverage.

28. When evidence basis and release decisions are recorded

(a) Record the proposed evidence basis required at Gate 3 and confirm the plan before Gate 5. It is a versioned planning decision, not an immutable assertion of proof. Gate 8 records what was actually demonstrated; Gate 10 confirms the basis supports the final wording. Material changes to claim intent/evidence basis require a controlled revision and targeted re-review, not silent editing or automatic backtracking of every later unaffected decision. A claimed finished-product effect cannot be exempted

merely by selecting “ingredient-level evidence”.

(b) Record the technical stability/compatibility conclusion at Gate 9. Record the market/version-specific authorisation to release at Gate 11, linked to the approved Gate 9 evidence and Quality release pathway. Separate fields avoid confusing a successful test conclusion with launch permission. Actual batch release remains linked to the external GMP/Quality record.

29. Artwork approval versus release history

Answer Read both. Packaging Specs & Artwork Evidence holds the approved artwork revision, file and linked Claim IDs/approved claim revisions. Released Label Control records which approved label/artwork/formula version is authorised and actually used in each market, plus transition and reconciliation. Gate 11 confirms that the proposed release matches the approved record; a filename alone is not approval. A Yes and actual market-release date are recorded after deployment, not required before first-launch authorisation. Do not force a false “already released” answer to pass Gate 11.

30. Market-specific packaging requirements

Answer Yes, Regulatory maintains versioned market profiles with source, effective date and reviewer. Link the applicable profile requirements to the project's packaging/artwork checklist. Gate 6 closes identification/assignment of those requirements; Gate 10 verifies compliant final artwork/dossier; Gate 11 verifies the approved version for release. A filled market-profile field is not proof of product compliance. Blank is unassessed; N/A needs a reviewed rationale. Relevant profile changes trigger the impact assessment described in Question 1(d).

31. Register-by-register applicability: all 78 registers

“Required” means a substantive assessment/record or a valid link to approved reusable evidence. “Conditional” requires a documented applicability decision. “Reference” means controlled reference content; it does not require duplicate project signatures. Existing evidence may be reused where its version and applicability are confirmed. Due dates/gates apply to the relevant market or review cycle.

(a)-(d) A claim-free product still needs safety, stability, microbiological-risk and manufacturing evidence. Its prospective plan and applicable protocols therefore remain required. Competitor/scientific work can be reused or waived for a verified administrative-only scope. “No claims” waives only claim-specific registers/activities, after checking the label, website and other intended material contain no express or implied efficacy claims. All public information still needs approval. ASEAN-only projects can omit a duplicate non-ASEAN checklist, but cannot omit a per-market compliance/readiness conclusion.

Group A - 13 registers

Register	Rule	When / what satisfies it
Development Brief	Required	Gate 2; include change scope for an administrative project.
Framed Scientific Research Questions	Required / scope-dependent	Gate 2 for development or scientific changes. Administrative-only work may link the approved baseline and record no new question.
Vulnerable-User Assessment	Required	Gate 2; an explicit reviewed “none identified” is a valid conclusion.
Competitor Product Register - Identity, Claims & IP	Conditional	Gate 3 for new/repositioned/benchmark-led work; reviewed reuse or justified administrative-only waiver allowed. Blank change type is not a waiver.
Supplier & Raw Material Evidence	Required	Gate 4 for selected materials; update at Gate 6. Reuse approved current records where applicable.
Prospective Evidence Plan	Required	Gate 5; includes safety/quality/stability even without efficacy claims. Administrative work can link the approved plan with no-new-testing rationale.
Packaging Specs & Artwork Evidence	Required	Gate 6 specifications; Gate 10 approval. Link approved unchanged packaging where appropriate.
Ingredient-Level Safety Matrix	Required	Gate 7; cover the final formula and relevant exposures.
Detailed Test Protocol	Required for applicable testing	Gate 8 before new testing; use approved linked protocols/reports for accepted existing evidence. No new claim test is needed solely because this register exists.
Stability, Compatibility & Release Evidence	Required	Gate 9 technical evidence; Gate 11 authorisation. An accepted existing baseline can be linked for an unaffected administrative change.
Publication Approval Register (with Publication Rules)	Required	Gates 10-11 for planned external material, including label/instructions. Existing approvals can be linked when unchanged.
GMP Links	Required	Gate 11; current manufacturing/Quality release pathway and linked controlled evidence.

Register	Rule	When / what satisfies it
Released Label vs Current Artwork Register	Required	Gate 11 initial approved baseline; record comparison and subsequent market reconciliation. “No previous label” is valid for first launch.

Group A2 - 1 register

Register	Rule	When / what satisfies it
Regulatory Checklist Status (per market)	Required per-market conclusion	Gate 10. Non-ASEAN components use this register. ASEAN can link the shared PIF checklist/map, with country-specific confirmation and local additions; no duplicate checklist solely for form.

Group B - 2 registers

Register	Rule	When / what satisfies it
Claim -> Evidence Traceability	Conditional	Gate 3 onwards if claims proposed; explicit reviewed “no claims” permits no claim rows.
SKU Claims / PIF Register	Conditional	Gate 10 for every active claim/use. The verified no-claims conclusion can waive claim rows, not the PIF or publication controls.

Group C - 2 registers

Register	Rule	When / what satisfies it
General Restricted & Caution Assessment	Assessment required; findings may be empty	Gate 4 screen and Gate 7 closure. Explicit reviewed no-issues conclusion if no findings.
Critical Safety Findings	Conditional findings log	Gate 7 and later when findings arise. The final safety assessment confirms whether any findings remain.

Group D - 31 fixed-row / reference sheets

Sheet	Rule	When / what satisfies it
ASEAN PIF Checklist (Closure)	Conditional required	Gate 10 for ASEAN market use; common evidence plus local requirements.
Final Safety Sign-off	Required	Gate 7 final formula; Gate 10 confirms current applicable approved safety version.
Pregnancy / Breastfeeding Caution Limits	Conditional required	Gate 4 screen and Gate 7 closure where maternal use/contact applies; otherwise reviewed N/A.
Prohibited Ingredient Watch-list	Required screen	Gate 4 all relevant rows; Gate 7 closure. Not a substitute for full market screening.
Protocol Setup	Conditional required	Before human-study recruitment/testing at Gate 8; no human study requires a recorded applicability decision.

Sheet	Rule	When / what satisfies it
Target Product Profile (TPP)	Required	Gate 3 initial scope; Gate 5 agreed specifications. Reuse baseline for an unaffected administrative change.
ASEAN PIF / Dossier Map	Conditional required	Gate 10 for ASEAN use; each required section must resolve to current evidence or approved N/A.
Anatomy, Physiology, Exposure Science & Contradictory Evidence	Required scientific basis where relevant	Gate 2 for new needs/use/exposure; link reviewed baseline for unchanged administrative work. Consider contradictory evidence.
Artwork Change Control	Reference	Trigger/approval rules; actual applicable changes recorded in CHG.
Backbone / Platform Technology	Required for development choice	Gate 5; reference approved platform/equivalence where unchanged; administrative-only waiver allowed.
Carrier Review - Summary	Conditional required	Gate 2/5 where carrier choice affects delivery, exposure or performance; reference approved baseline if unchanged.
Change Templates / Forms	Reference	Controlled company form index.
Efficacy Assurance Control	Conditional required	Gate 5 planning and Gate 8 verification for efficacy/performance claims.
Evidence Hierarchy	Reference with enforced rules	Controlled hierarchy; checks applied at the decision gates in Question 34.
Evidence Template Index	Reference	Keep current company template versions; link templates used.
Formula Change Control	Reference	Controlled trigger/approval rules; actual controlled changes use CHG.
Fragrance Workflow	Conditional required	Gate 4/7 when fragrance/aromatic materials or relevant allergen risks are present or changed.
Landscape Decision Summary	Conditional required	Gate 3 for development/repositioning/benchmark decisions; may reuse approved administrative baseline.
Comparative Testing Protocol	Conditional required	Before comparative testing used at Gates 3/8 or in claims; planned protocol initially, completed report later.
Current Solutions & Standard of Care	Conditional required	Gate 3 for the new need/positioning comparison; reviewed reuse for unchanged scope.
Artwork / Label Review Checklist	Required	Gate 6 preliminary applicability; Gate 10 compliance; complete before Gate 11 Final proof release.
Literature-Search & Referencing Standard	Reference with enforced rules	Use versioned standard; linked search completeness checked per Question 34.
Literature-Search Method	Required when scientific basis is used	Gate 2/3 initial search, before Gate 5 reliance, then update for final evidence/claims at Gate 10.
Safety / Medical Summary	Required safety summary	Gate 10; may derive from approved safety assessment, with relevant market/population conclusions.

Sheet	Rule	When / what satisfies it
PIF Evidence Closure (Workflow)	Required applicable closure	Gate 10 dossier completeness; Gate 11 confirms the approved version remains valid.
Product / Project Identification	Required	From project creation; exact product/formula/sample identity before Gates 4/5/8 evidence reliance.
Product Safety Profile	Required	Gate 7 final assessment and Gate 10 confirmed current summary; may derive from approved evidence.
Publication Rules	Reference with enforced rules	Apply approval rules at Gates 10-11 and whenever external content is released.
System Requirements	Reference	Company system rules; no project-specific fabricated answers.
Transferability & Inference Rules	Reference with enforced rules	Apply to each evidence-to-need/claim inference under Question 34.
Twinkle 5 Claims Map	Conditional required	Gates 3 and 10 when that claim framework is used; otherwise explicit N/A.

Group E - 29 activity-dependent registers

Register	Rule	When / what satisfies it
Carrier / Emollient System Review	Conditional required	Gate 2/5 when selecting/changing a carrier or emollient system relevant to safety/performance.
Ready-to-Answer Pack	Conditional	Gate 10 before issuing the corresponding approved external information; may be generated from approved evidence.
Needs -> Technology Traceability Matrix	Required for development linkage	By Gate 5 for new/revised needs or technology; reviewed baseline link for administrative-only scope.
Needs - Executive Brief	Optional presentation	No extra gate block if the approved Development Brief contains the decision basis.
Mechanism & Claims Evidence Map	Conditional required	Gate 3 planning and Gate 10 final support when mechanism-based claims are proposed.
Social Media & Marketing Campaign Register	Conditional required	Before each campaign/content release, normally Gate 11; record earlier approved concept planning at Gate 3 if used.
Development Iteration Log	Conditional required	Record trials/iterations at Gates 4/5/8 when they occur.
Ingredient Monograph	Conditional required	Gate 4/5 for new/PI/claim-driving or otherwise flagged ingredients. Approved material evidence can satisfy routine ingredient review without a duplicate monograph.
Ingredient Substitution Evidence	Conditional required	Whenever substitution occurs; assess before Gate 4/7 acceptance and before controlled implementation.
Team Feedback & Competitor Benchmark Notes	Conditional record	Record feedback/benchmark activity when used in a decision at Gates 4/5/8.

Register	Rule	When / what satisfies it
Formulation Change Register (Final Approver Controlled)	Conditional required view	Every controlled formula change; master CHG linkage and NP decision before implementation. See Questions 11 and 32.
Potency & Process Control Evidence	Conditional required	Gate 5 planned controls and Gate 8/9 verification for potency, critical process or scale-up risk.
Product Family & Version Register	Required identity baseline	By Gate 5/6; even a single product has an initial controlled identity/version. May be generated from master records.
Platform / Channel Rollout & Stock Confirmation	Conditional required	Gate 11 for relevant channel/stock transition; actual rollout events after authorisation. No stock transition needs a reviewed N/A.
Shipment Label & Batch Verification	Conditional required	Before the first affected shipment and each relevant verification event. A future shipment is not required to have occurred before initial authorisation.
Eye Safety Evidence	Conditional required	Gate 7/8 when exposure/claims/risk trigger it; document the risk-based evidence choice or waiver.
Fragrance / Allergen Log	Conditional required	Gate 4/7 when fragrance, allergens or relevant aromatic/impurity risks apply, including formula/supplier changes.
Clinical / Human Evidence	Conditional required	Gate 8/10 when human evidence is generated or relied on; link approved external reports if reused.
Efficacy Study Plan	Conditional required	Before Gate 8 efficacy work where a study is needed; no new study if existing evidence is accepted with rationale.
Functional Efficacy Evidence	Conditional required	Gate 8/10 for claims requiring performance evidence; trace each claim to the actual report.
Microbiology & PET Evidence	Required risk conclusion; testing conditional	Gate 9, with testing planned at Gate 8. PET/test waivers need a reviewed microbiological-risk basis.
Participant / Sample Log	Conditional required	Before/during applicable Gate 8 work; internal laboratory samples can use a sample-only trace without participant fields.
HCP / Distributor Efficacy Answer	Conditional required	Before issuing an efficacy answer, after its evidence/claim review at Gate 10/11.
HCP Test Report Pack	Conditional required	Before issuing a report pack; only approved, correctly scoped reports/wording.
PIF Evidence Export	Conditional event record	Whenever a PIF export is produced/shared; Gate 10 still needs a complete mapped dossier even without an export.
Publication / Deployment Record	Conditional mandatory event record	For every actual print release/publication/deployment; link the approved version. Not demanded before the event has occurred.
Batch Formula Trace	Conditional mandatory production record	For every manufactured/released batch and SKU/pack allocation before its release/shipment. Gate 11 needs the traceability pathway; future batches are added when made.

Register	Rule	When / what satisfies it
MBc360 Feedback	Optional	System/process improvement feedback; no product gate block merely because none is submitted.
Test Report Index	Required when reports are relied on	By the gate using the reports; may be auto-generated from unique linked reports. No duplicate manual indexing.

32. Change Control before a new formula version

Answer For a change to a controlled/locked or released formula, yes: approve the linked master CHG before creating the controlled replacement formula version for implementation. Evaluation samples may be developed under the submitted CHG as clearly unapproved trials; they cannot overwrite or release the controlled version. Routine pre-lock development iterations use the iteration log; retain the Major-version CHG rule in Question 11. NP's required commercial approval and qualified technical approvals remain part of the controlled-change route.

Record retrospective changes promptly and apply the same gate and release controls. Assess its actual impact, raise a deviation where necessary, and hold/reopen affected current readiness until it is reviewed. A late record must preserve the real implementation date and approval gap.

33. Which watch-list rows Gate 4 screens

Answer No. Gate 4 screens every relevant ingredient/raw-material candidate against the applicable prohibited/restricted list and, where maternal use/contact applies, the maternal caution list. “Linked gate” identifies an additional/detail closure point; it does not postpone initial screening. Packaging-related substances are assessed when packaging is selected at Gate 6, with an earlier applicability decision where possible. Gate 7 closes all relevant issues for the final product. Retinol or a maternal-listed essential oil in the candidate formula cannot escape Gate 4 screening because the reference row says Gate 7.

34. Enforcing evidence grades, transferability and search records

(a) Use Gate 5 for “progress to formula” and Gate 10 before approval of external claims/label information, with Gate 11 verifying the authorised final revision before actual release. Gate 2 needs the graded scientific basis for the proposed need; Gate 3 needs the preliminary claim grade and evidence plan. Gate 8 updates the grade from completed testing. Development hypotheses may remain exploratory, but cannot appear as established efficacy.

(b) Apply the standard to scientific need statements and claims on Sheets 1-5, Mechanism & Claims Evidence Map, Efficacy Assurance Control/Study Plan, Functional Efficacy Evidence, Clinical/Human Evidence, Claim -> Evidence Traceability, SKU Claims/PIF, Twinkle 5 and HCP/distributor efficacy answers. Check any new efficacy assertion in a monograph, report pack or marketing material. A need's scientific premise needs a grade; a purely commercial preference can be marked “not an efficacy/scientific assertion” with rationale. Apply the relevant validity checks to Regulatory certificates, stock logs and administrative records; efficacy grades do not apply to those records.

(c) Yes, require a grade under the existing controlled A-E hierarchy at the gate that relies on the assertion. Record preliminary and final/current grades separately; Gate 8 cannot be the first required entry if the evidence was already used at Gate 5. Inadequate evidence stays identified as a hypothesis/unsupported proposition and cannot authorise an efficacy claim. Use the controlled A-E grade definitions.

(d) Record six structured checks: same active/material identity; dose; vehicle; exposure/use; endpoint; and combination effects. Each needs Pass/Fail/Unknown, or a justified N/A where a test genuinely does not apply, plus rationale and evidence. Derive an overall “transferable” or “inference only/insufficient” conclusion; a qualified reviewer confirms it. Any unresolved mismatch/unknown prevents an A/B finished-product

conclusion derived from that source and caps that inference at C under the existing rule. Strong direct evidence on the actual final product is assessed on its own merits. Use the controlled “designed to” inference wording where applicable, subject to Regulatory approval; those words cannot rescue a prohibited or unsupported claim. Ingredient evidence does not automatically prove a finished-product outcome.

(e1) Use one project search register with multiple search entries/topics and explicit links to the need, ingredient, claim and relevant evidence revision. Reuse a search entry across pages when it truly covers them; require a new or updated search for a different question or material scope change. Do not copy the same table into five pages.

(e2) A complete record identifies the question/topic; database/source and coverage; exact search string/filters; search date and person; inclusion/exclusion criteria; screened/included counts, including zero; search results/export or record links; key included and contradictory evidence; and reviewer/conclusion. Link both the supported need/Claim ID and the included sources using DOI, PMID, stable URL or internal report ID. Counts alone are insufficient. Link internal reports through their controlled report IDs.

(e3) Search the sources appropriate to the question. For each standard source, record Searched, or Not applicable with a reason; do not leave a blank row. A patent search is expected for novelty/IP questions; clinical/trial searches for relevant clinical assertions. Supplier-only evidence needs an explicit basis and quality assessment. An absence of findings is a recorded result, not proof of benefit or safety.

35. Stage Complete before a Proceed signature

Answer Yes, require a completed stage assessment before signing Proceed or Proceed with Conditions, and enforce it in the underlying approval rules as well as the screen. Define Complete as “required assessment complete”; accepted non-blocking Next Actions may still be open under Proceed with Conditions. If “Gap” is used to describe the issue history, retain the gap assessment rather than forcing its deletion to select Complete. Hold/Backtrack remain available before completion. A later substantive change to the signed assessment needs controlled re-review.

36. Working off accepted conditions after gate approval

Answer Verified completion of an accepted condition can leave the original signatures valid, with an append-only action history and closure evidence. Preserve the accepted action, owner, due date, priority and criteria in the signed snapshot, with current execution status shown separately. Completion alone need not trigger three new signatures.

Do not treat cancellation, owner changes or due-date extensions as automatically harmless. A qualified owner reassignment with unchanged competence/scope can be recorded without gate reapproval. A due-date extension, cancellation, priority reduction or scope/criteria change needs authorised impact review; if it weakens the accepted risk control or a release prerequisite, reopen the affected decision. Escalate overdue conditions. New problems retain the originating gate/finding and CHG link, even if recorded while a later gate is open; their impact can require reopening the earlier gate. Completing conditions does not rewrite a historical conditional decision into an unconditional one.

37. Owner functions and named project people

(a) Use explicit functional assignments; do not derive professional authority from a similar job label. Project owner -> Project Manager is acceptable only if that person is the nominated accountable owner. Assign R&I; to the nominated R&I; reviewer and Procurement to the Raw Material Coordinator. Marketing/Sales -> nominated commercial lead can work where explicitly assigned. Confirm Formulation/NPD -> Technical Services against the person's actual remit. Reject automatic Quality -> Production Support and Packaging -> Sales Manager: neither label establishes the relevant function. Correct misleading form labels.

(b) Add named functional owners or allow the project Lead to nominate authorised people from the company role matrix: Safety/Scientific Review; Clinical/Study Coordinator; Technical Claims; Regulatory Claims;

Quality; Manufacturing; Packaging/Artwork; Finance; Legal/IP as applicable. Joint Owner cells can require more than one function. If unavailable, show Unassigned and block decisions that need that authority; do not silently substitute the Lead. Record the authorised role matrix and named assignments.

38. Change references and artwork links

(a) “Artwork Change Control ref” points to the actual master CHG record, not the name of a trigger. Keep trigger/type as its own field.

(b) Yes. The Change Control & Communication ID, Change register ID and Linked Change ID fields should resolve to the master CHG, with legacy FC IDs retained as aliases where needed. Use validated selections scoped to the relevant project/product; any authorised shared cross-project change must explicitly list its affected projects.

(c) Yes. One artwork revision may implement several linked CHGs, and one CHG may affect several artwork revisions. Support multiple links, show one primary record where useful, and verify that every relevant linked change is resolved or validly accepted before release. Never silently erase an unmatched imported typed reference; retain it and flag reconciliation.

39. Batch Formula Trace row identity

Answer Retain the generated Trace ID. The application should support a bulk lot used across pack sizes/SKUs/allocations rather than require the lot string to identify one row globally. Display a meaningful selection such as “BT-007 | batch 24B017 | SKU/pack | formula version | date” so the verifier can recognise it. Use lot + site/manufacturer + product/allocation context as needed and flag genuine duplicate trace rows. Preserve original imported references for reconciliation; unmatched values must not become silently blank.

40. PI names and artwork checklist completion

(a) Treat the five naming rows as a company-wide controlled reference list. R&I; maintains ingredient identity and preparation mapping; Regulatory checks INCI/market labelling; the authorised brand/trademark owner approves trade names. Record the effective date, approved name/spelling, trademark form, market/context and transition rule. Do not assume a changed trade name applies instantly to every existing label. New work uses the current approved rule; existing stock/artwork transitions follow a documented CHG decision. Record the approved Honey and other PI transition rules in the controlled reference list. A technical extract description must not be represented as a verified INCI name without confirmation.

(b) Identify applicable checks at Gate 6, complete regulatory/claims review at Gate 10, and require all applicable checks complete before Gate 11 Final proof release. Conditional N/A needs rationale and appropriate reviewer. Keep the eight review tasks, including one “PI names match the approved company list” check with an Owner and Status; do not count each reference name as another task.

(c) The controlled trade-name list governs approved spelling/identity wherever the trade name is used in claims and label copy. It does not replace the required ingredient declaration or prove efficacy. Match preparation, botanical identity and approved naming context; retain the list revision used in the approved artwork.

41. Incomplete raw-material evidence as a stored state

(a) No. Store “Incomplete - evidence review required” as an explicit default state and display it clearly in the row, readiness list, filters and exports. A grey hint on an empty cell is too easy to lose outside the editing screen. An incomplete imported record must block the relevant Gate 4 acceptance.

(b) Keep a distinct evidence disposition because workflow Status and “Approved for Use?” answer different questions. Use Incomplete - evidence review required; Under Review; Approved for Use; Conditionally accepted - controlled action open; Not Approved; Considered - not used in this formula. Derive the Approved

for Use flag from an authorised decision; do not allow contradictory values. Conditional acceptance requires qualified review, bounded non-critical residual risk, a linked action and scope/expiry. Missing essential safety/regulatory identity or composition evidence cannot be cleared merely by selecting conditional acceptance.

42. Several internal-panel samples in one project

(a) Yes, support both successive formula versions and simultaneous variants/comparators. Preserve the sample identity, formula revision, batch, preparation and study/protocol link for each.

(b) Use one underlying feedback log with a required Sample ID on every row, showing a separate filtered log and summary per selected sample. A combined view may compare samples without mixing totals. Where one tester assesses several samples, retain the tester/study linkage and assessment order/date so paired responses remain traceable. Preserve imported default-sample attribution and allow reviewed correction without losing history.

(c) Use a validated CHG link where the sample relates to a controlled change. A pre-lock development sample can instead link to its iteration and have CHG recorded as not applicable with the relevant context. A trial sample requires CHG only when it relates to a controlled change. Panel work still follows its applicable human-study/safety approval route before participant use.
